DATA236

ASSIGNMENT b6

PROBLEM 1:

a) Cloud provider ensures the security "in" the cloud, while the customer is responsible for security "of" the cloud.

Ans: False

b) Traditional relational databases normally use scale up strategy in order to increase performance.

Ans: True

c) The technology which made data centers save most of the cost is virtualization?

Ans: True

d) The client-server approach has excellent scalability.

Ans: False

e) Cloud service providers are able to devote resources to solving security issues that many customers cannot afford, so security is not the number one obstacle for companies moving to cloud.

Ans: False

PROBLEM 2:

Please give the whole names for the following acronyms: C MP, MTTF, AWS, VPC, JVM.

Ans:

Cloud Management Platform

Mean time to failure

Amazon Web Services

Virtual Private Cloud

Java virtual machine.

PROBLEM 3:

Which of the following is for client-server model, mainframe/supercomputer, grid computing, fabric computing, utility computing, p2p networks?

a) metered service

Ans: Utility computing

b) distributed architecture with each node plays both consumer and supplier roles

Ans: p2p networks

c) different users/organizations contribute spare computing resources for a common computation intensive tasks

Ans: Grid computing

d) web-browsing

Ans: Client-Server model

e) a huge centralized database service

Ans: Mainframe / Supercomputer

f) everyone can freely use the resources or services without any contribute

Ans: p2p networks

g) loosely coupled distributed system with different autonomous parties

Ans: Grid computing

h) tightly coupled system under one administration.

Ans: Mainframe / Supercomputer
